

# Spring Wheat Analysis in Manitoba and Saskatchewan

Automation & Digital Agriculture  
Data Analysis Stream Final Project

Tao Zhe (Evan) Wu  
October 2023

# Scoping

Nearly a billion people will go hungry tonight, yet this year the U.S. will turn nearly 5 billion bushels of corn into ethanol. That's enough food to feed 412 million people for an entire year.

How about Canada? Are Canadian farmers lowering wheat production for canola?

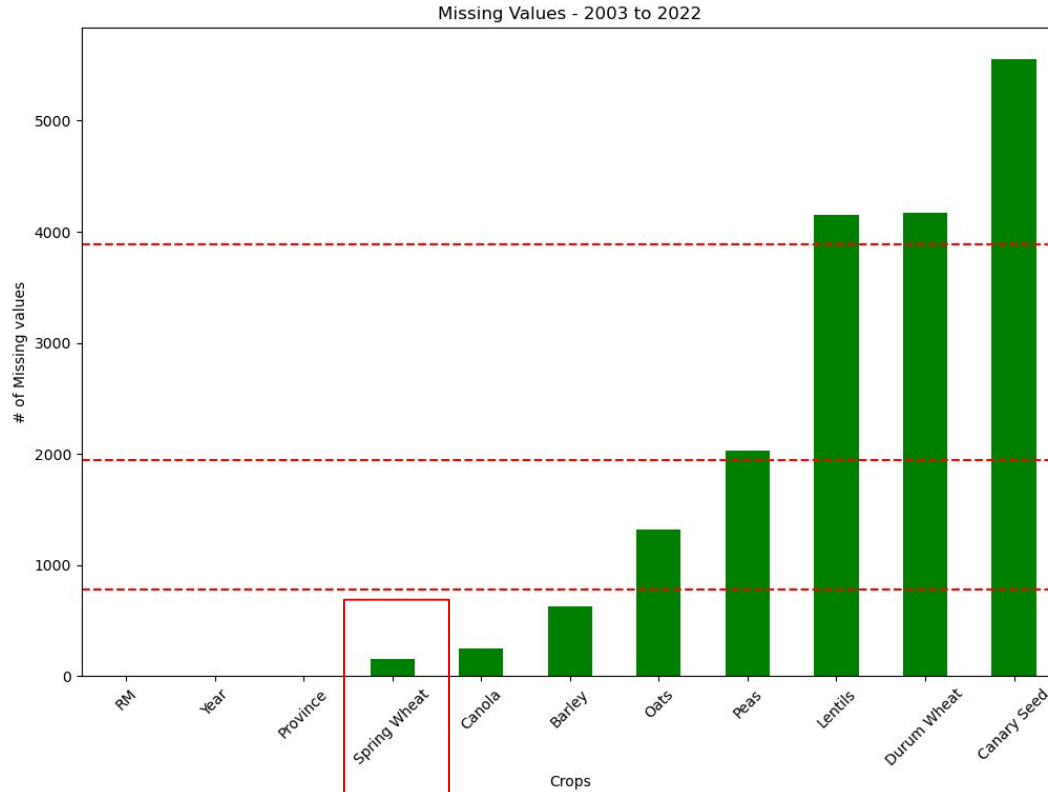

# Data Collection

- Saskatchewan Yield Data Source  
(<https://dashboard.saskatchewan.ca/agriculture/rm-yields/rm-yields-data#rm-yields-tab>)
- Manitoba Yield Data Source  
(<https://www.gov.mb.ca/agriculture/markets-and-statistics/crop-statistics/index.html>)
- Manitoba and Saskatchewan Shapefiles are provided by Instructor (Ruhid)

# Data Transformation

- Yield unit conversion
- String formatting for RM names and column (crop) names to join the datasets
- Combine the joined dataset with geo database for visualization

# Exploratory Data Analysis (EDA)

- Spring wheat has the lowest missing values - it's popular in Manitoba and Saskatchewan!

# Exploratory Data Analysis (EDA): Distribution

# Exploratory Data Analysis (EDA)

- The wheat yields are now normally distributed

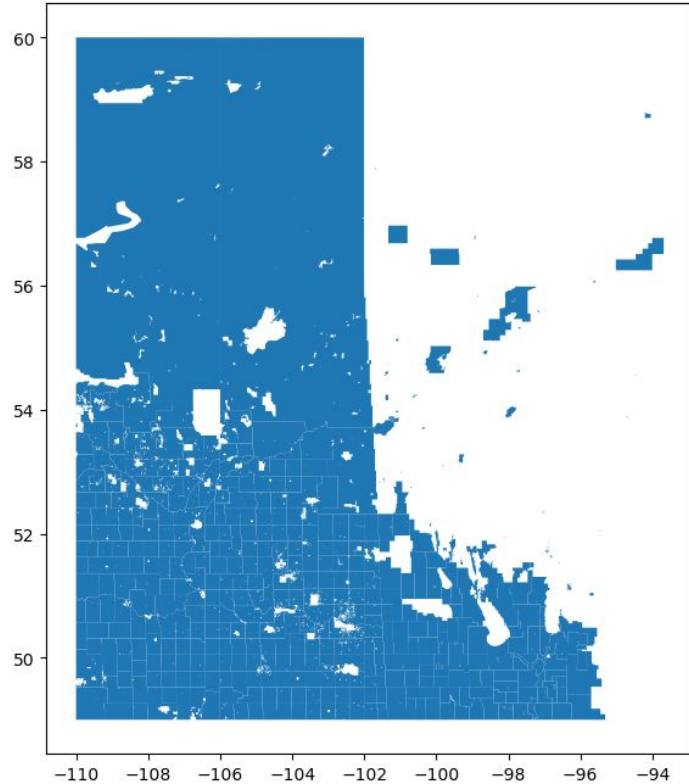

# Exploratory Data Analysis (EDA)

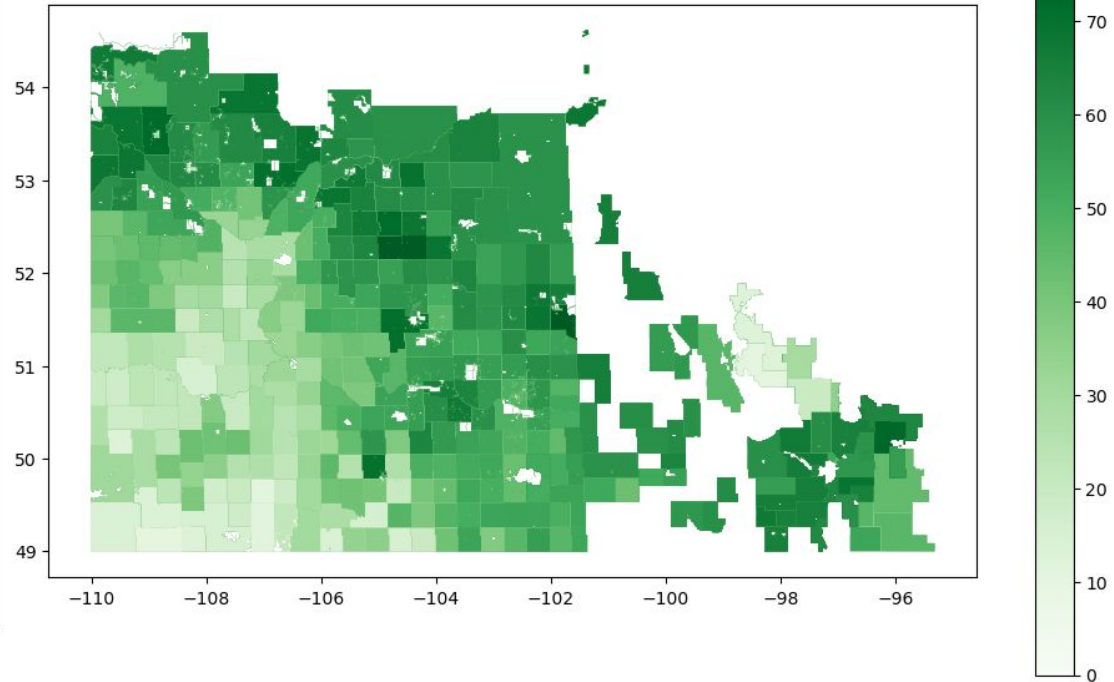

- Canola, Barley, Durum Wheat, and Oats have strong correlation with Spring Wheat.

# Exploratory Data Analysis (EDA): Visualizations

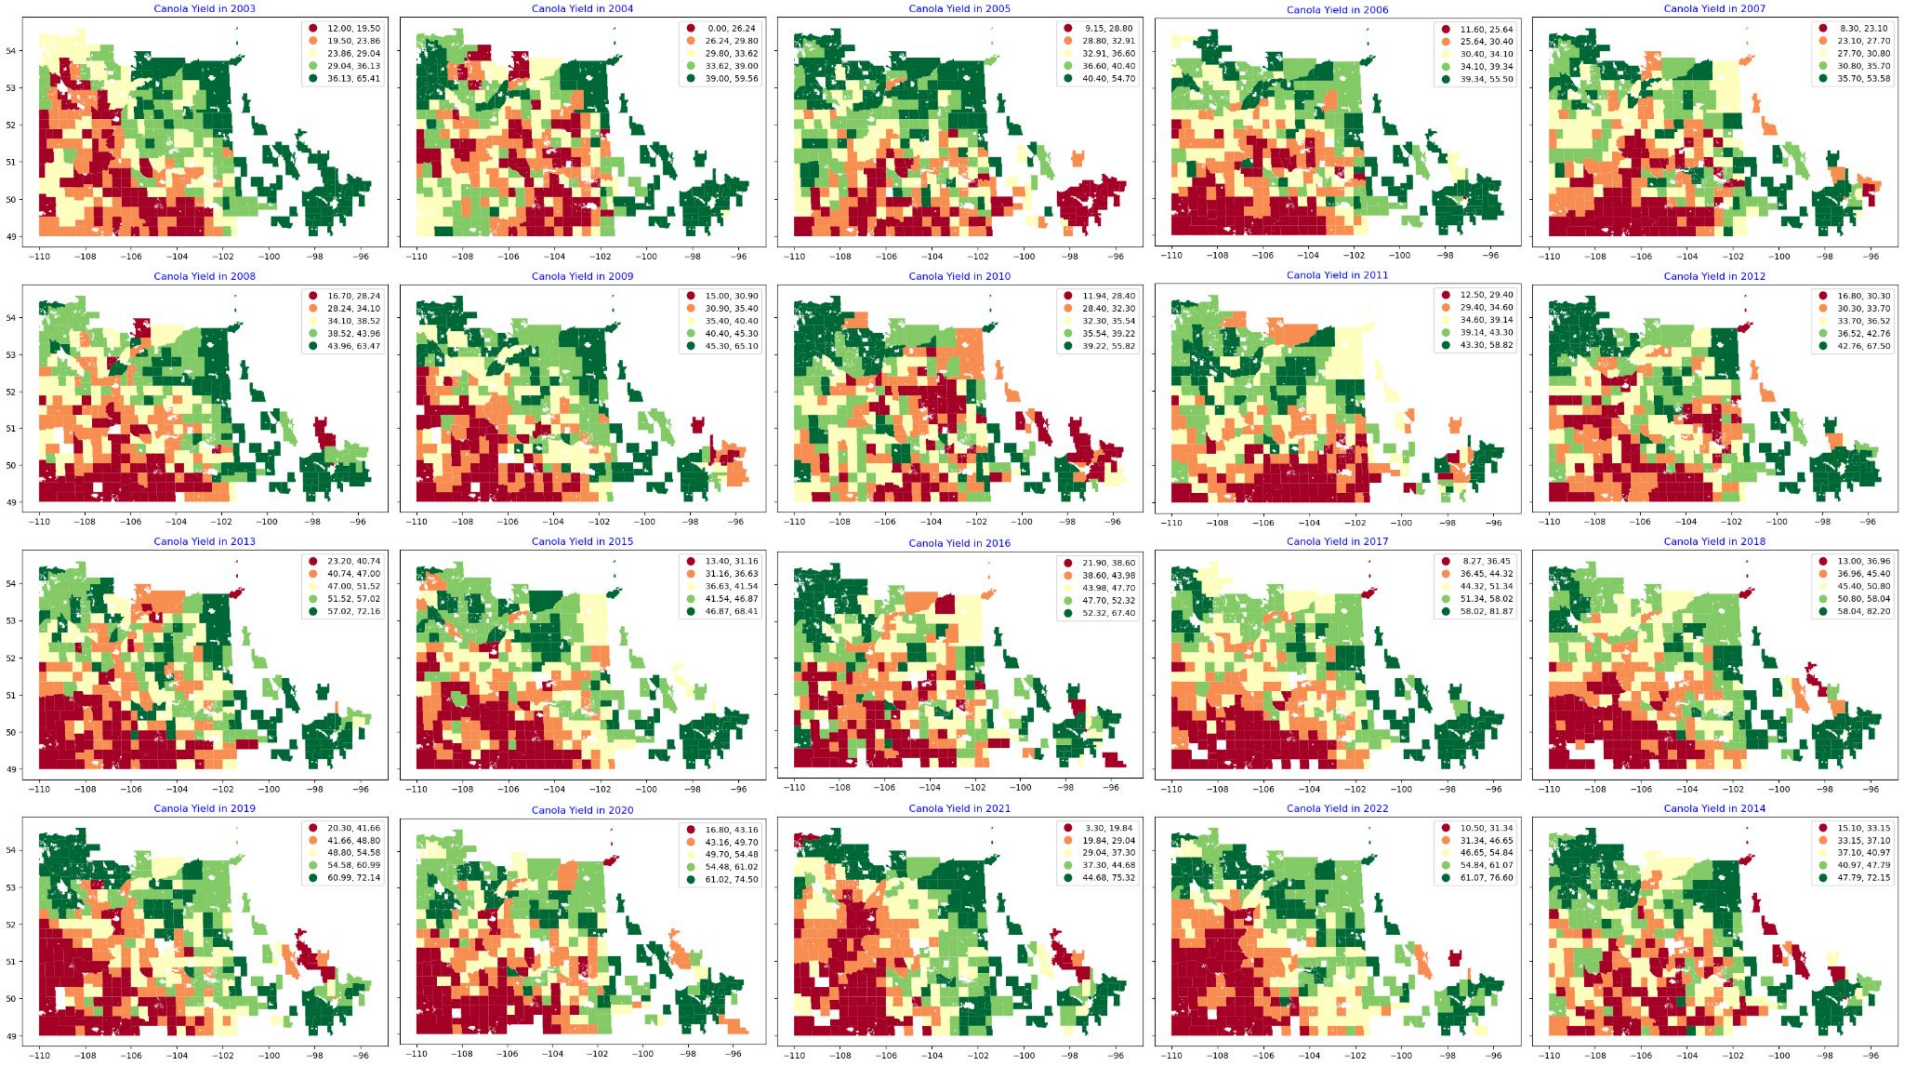

- Spring yields are reported in 349 out of all 481 RMs

# Exploratory Data Analysis (EDA)

- The wheat yields are generally lower in southwest, likely due to Canola.

# Methodology

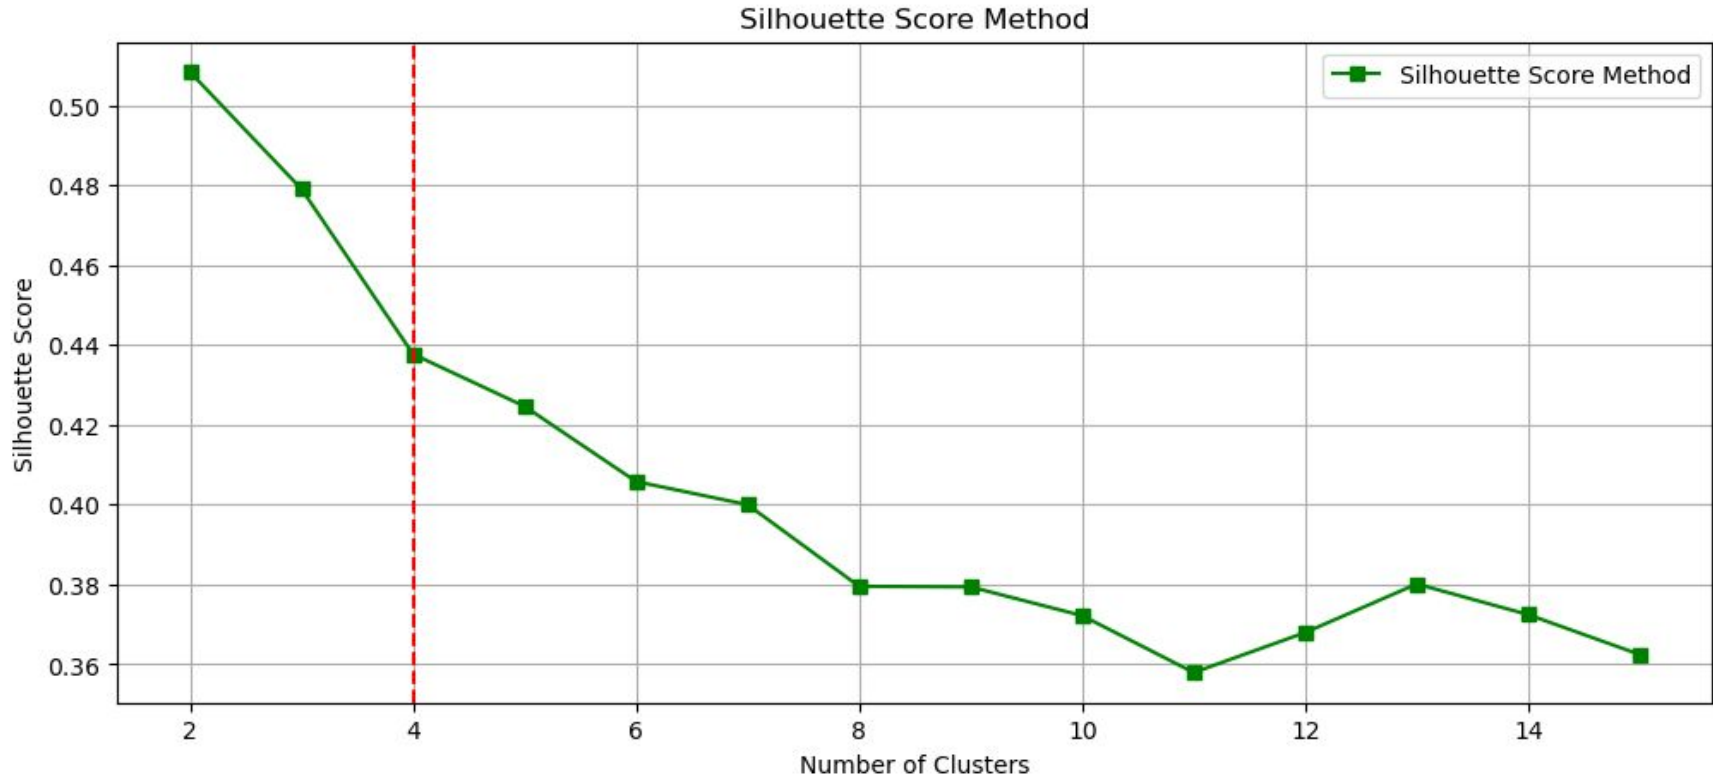

- K-Means clustering method is used to classify the RMs
- For this project, only Spring Wheat data are analyzed
- The mean and standard deviation of wheat yields over 2003-2022 in each RM are used for clustering
- The RMs are clustered into 2 to 15 groups, and Elbow Method and Silhouette Scoring are used to determine the proper number of clusters

# Elbow Method

# Silhouette Score Method

N = 4

Spring Wheat Clustering Mean and Std | 2003-2022 | K-Means

N = 5

Spring Wheat Clustering Mean and Std | 2003-2022 | K-Means

N = 6

Spring Wheat Clustering Mean and Std | 2003-2022 | K-Means

A bad center

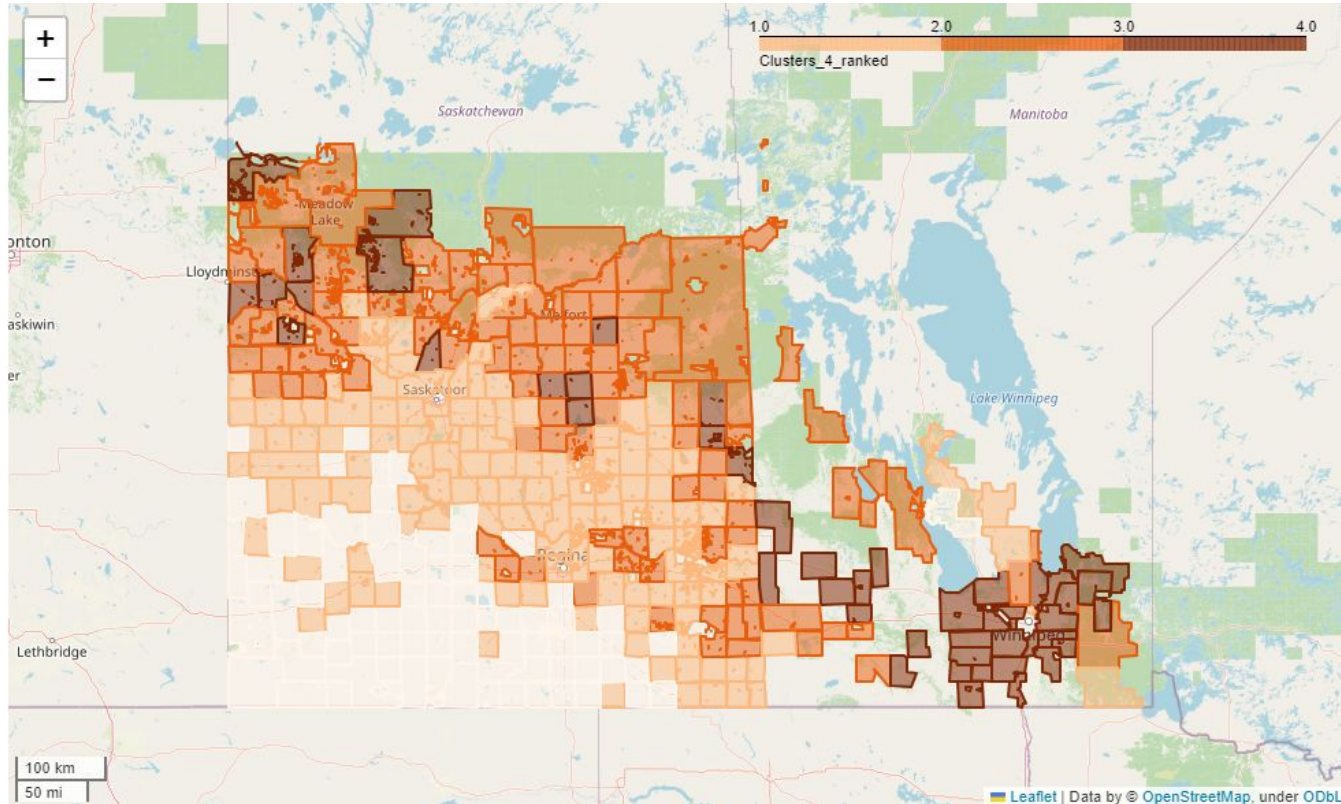

# Ranking based on Mean or Standard Deviation

	Spring Wheat_mean	Spring Wheat_std
Clusters_4		
0	29.076890	8.166517
2	37.354170	9.586894
1	44.498793	10.187763
3	51.716221	13.282003

	Spring Wheat_mean	Spring Wheat_std
Clusters_5		
1	26.854778	7.954952
2	33.423295	8.653647
3	39.004220	9.989843
0	45.068284	10.172036
4	51.716221	13.282003

	Spring Wheat_mean	Spring Wheat_std
Clusters_6		
2	26.854778	7.954952
1	33.341542	8.660789
5	38.835044	9.966704
4	44.231024	9.698660
3	48.582343	12.481640

# RMs Ranked in Spring Wheat Yielding with N=4

# Results & Conclusions

- Canola, barley, durum wheat and oats are found to be highly correlated with spring wheat yielding.
- Yearly spring wheat yields in 351 Manitoba and Saskatchewan RMs from 2003 - 2022 are mapped and visualized.
  - Spring wheat is in general very popular in both provinces, but **southwest Saskatchewan** grows **less and less spring wheat since 2016**
- RMs are clustered using K-Means method based on the mean and deviation of Spring Wheat yields in 2003-2022.
  - N = 4 is the elbow point with highest Silhouette Score.
  - The rankings of RMs are visualized on map.
- Successfully observed the change of spring wheat yielding visually over years, and ranked each RM based on the yield potential and stability.

# Future Works

- Analyze other crops to explain the drop in spring wheat yielding in southwest Saskatchewan. Temperature, precipitation, and soil type might be considered as factors.
- Canola, barley, durum wheat and oats are highly correlated with spring wheat production. They might be in a crop rotation cycle. The effectiveness of crop rotation in increasing spring wheat production can be analyzed.
